The Action and Observations are seen as conjunctions:

$$do(X_i = x_i) \Leftrightarrow s_i \rightarrow (x_i \rightarrow y_i) \text{ and } \Pr(Z = z) \rightarrow do(X = x).$$

We define:

X as control variables ($\exists i$ such that $\exists X_i$) and

Z and observed fixed variable

U latent unobserved variable and

Y outcome variable.

Ports of Call: **Expérimentation:** (Uniform Distribution and Riviera at Côte d'Azur: Ticket for Venice, Verano as Chord and Inconito).

The chartered definition of **auto-similarity** is: the same decoupage at a lower scale. The scale decreases and there is an **homeomorphism**. The vehicle of auto-similarity is the *heart*, auto-similairly (independent of the magnification) and the *branches ling and nerf system*.

The Chaos Theory gives applications in the **regulation of the intermediary metabolism**. The biological phenomenons have a **rhythm** with quasi-regular oscillations. (rest or activity).

Advantage of the theory: reducing *complexity* of physiological reactions in pathological states. The normal state is young and characterised cahotic. The gain for Aeging is towards normal dynamical systems, towards loss of adaptibility of the organism to variate conditions. Is it a formalism ? *Est-ce un formalisme ?* We quantify Aeging effects, expressed in terms of complexity, without difference inbetween difference and determinism.

The Actor and the Use of the Secretary.

Global trend transition from political Talboden decision in sailing.

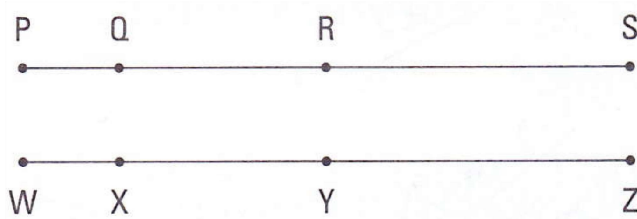

We have distances $||[AB]|| = 3$, and cost $4||[CB]|| = ||[AC]||$ at the picture below:

$$|[AD]| \geq |[AC]| \text{ and } |[DC]|^2 + 1^2 = 4x, \text{ leading to } |[DC]| = \sqrt{16x^2 - 1}.$$

$|[AD]|^2 + (|[CB]| + |[DC]|)^2 = |[AB]|^2$ as $1^2 + \left(\sqrt{16x^2 - 1} + x\right)^2 = 3^2$, for which the solution is: $x = \frac{1}{15}\sqrt{143} - \frac{2}{15}\sqrt{2}$.

$[AD] = [PW]$, $[DC] = [QR]$, $[CB] = [YZ]$ and this is a stochastic price seen on the image below

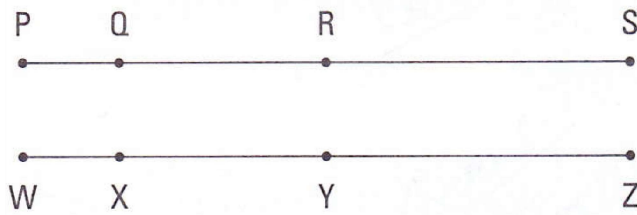

The sailing computation is the following:

The venture asset pricing is an almost a risk free calculation.

The boat heading (a tour point of the present company) is at an angle $\theta \in (0, \frac{\pi}{2})$.

We call $\vartheta = \frac{\pi}{4}$ as a Play Slimer from Personal and Friends.

We want to head the boat at that chosen angle: θ and turn from $[PQ]$ to its perpendicular $[XY]$.

We have $l = \frac{a}{\sin \theta} + \frac{b}{\cos \theta} = l_1 + l_2$. (called assets) and as $l \rightarrow \infty$ and then $\theta \rightarrow (0 \text{ or } \frac{\pi}{2})$.

The change is:

$$\frac{dl}{d\theta} = -\frac{a \cos \theta}{\sin^2 \theta} + \frac{b \sin \theta}{\cos^2 \theta} = \frac{b \sin^3 \theta - a \cos^3 \theta}{\sin^2 \theta \cos^2 \theta} \rightarrow 0$$

This leaves $b \sin^3 \theta - a \cos^3 \theta = 0$ $\tan \theta = \left(\frac{a}{b}\right)^{\frac{1}{3}}$ by association a Husband, and

$\bar{l} = \left(a^{\frac{2}{3}} + b^{\frac{2}{3}}\right)^{\frac{2}{3}}$ as a major size (see fat)

The enterprise will go round the corner if $l \leq \bar{l}$.

There is a business period in future if $\theta = \frac{\pi}{2}$ as a trend and also called LifeStyle.

This movement is also called **passing**. (gown)

$\vartheta_1, \vartheta_2, \vartheta_3$ is an angular progression where ϑ_1 a Proposal.
